**THE EU CYBER RESILIENCE ACT – TOWARDS A SAFE
AND SECURE DIGITAL MARKET IN EUROPE**

THE EU CYBER RESILIENCE ACT – TOWARDS A SAFE AND SECURE DIGITAL MARKET IN EUROPE

The EU's Cyber Resilience Act (**CRA**) was published in the Official Journal of the European Union on 20 November 2024, representing a significant step in EU cybersecurity regulation.

Originally proposed by the European Commission in September 2022, the CRA introduces mandatory cybersecurity requirements for products with digital elements made available on the EU market, establishing a consistent EU-wide legal framework for essential cybersecurity requirements for such products.

The CRA enters into force on 10 December 2024, with a phased application of its requirements thereafter. Whilst the majority of obligations under the CRA become applicable from 11 December 2027, others kick in sooner.

OVERVIEW

The CRA governs the cybersecurity of “*products with digital elements*” (**PDEs**), including any software, hardware or components thereof, made available on the EU market.

The CRA pursues four objectives:

1. ensuring cybersecurity standards for the design, development and production of PDEs throughout their life cycle;
2. ensuring a coherent cybersecurity framework for PDEs across the EU;
3. enhancing the transparency of the security properties of PDEs; and
4. enabling businesses and consumers to use PDEs securely, including through requirements for vulnerability and incident handling.

The CRA delineates between PDEs depending on their criticality and risk level (i.e., “critical products”, “important products” (subdivided into “Class I” and “Class II”) and the remainder being the “default category”).

As an EU regulation, the CRA is directly applicable in all EU Member States. For matters covered by the CRA, Member States should not impose additional cybersecurity requirements for making available PDEs on the EU market. However, Member States are entitled to impose additional cybersecurity requirements for the procurement or use of PDEs for specific purposes (such as national security or defence), provided that such requirements are necessary and proportionate.

SCOPE OF APPLICATION

The CRA imposes obligations and requirements upon economic operators for the design, development and production of PDEs made available on the EU market, the intended purpose or reasonably foreseeable use of which includes a direct or indirect, logical or physical, data connection to a device or network.

The “economic operators” in scope are manufacturers, authorised representatives, importers and distributors, and any other natural or legal person subject to obligations in relation to the manufacture of PDEs or making them available on the market (e.g., open-source software stewards), in each case where they supply a PDE for distribution or use in the EU in the course of a commercial activity.

Typical examples of PDEs include laptops, mobile devices, smart cards, routers, industrial control systems, mobile apps, video games and computer processing units. Remote data processing solutions are included where these are designed and developed by, or under the responsibility of, the manufacturer and the remote processing is necessary for the PDE to perform any of its functions. For example, cloud-enabled functionality provided by the manufacturer of smart home devices that enable users to control the device at a distance will fall within scope (e.g., connected home cameras). However, cloud services designed and developed outside the responsibility of a PDE manufacturer (e.g., IaaS service developed by a third-party cloud provider) are not within scope of the CRA.

The CRA excludes from its scope certain products and/or fields, mainly medical and in vitro diagnostic devices, motor vehicles (which are addressed by other EU regulations), spare parts for PDEs made available on the EU market that are manufactured according to the same specifications as the identical PDE components they are intended to replace, as well as PDEs which are developed or modified exclusively for national security or defence purposes, or specifically designed to process classified information.

The notion of “commercial activity” in scope not only includes charging a price for a product, but also includes charging a price for technical support services (where this does not only recuperate costs), an intention to monetise (e.g., providing a software platform through which the manufacturer monetises other services), requiring as a condition for use the processing of personal data (for reasons other than improving the security, compatibility or interoperability of the software), and accepting donations in excess of costs with the intention of making a profit.

KEY OBLIGATIONS

The key obligation imposed on relevant economic operators is that PDEs meet essential cybersecurity requirements set out in Annex I to the CRA. These requirements include ensuring that:

- PDEs do not have known exploitable vulnerabilities (i.e., vulnerabilities which have the potential to be effectively used by an adversary under practical operational conditions);

Overlap with EU AI Act

EU lawmakers recognised that AI systems may be caught as PDEs under the CRA. The CRA therefore provides that PDEs that are also high-risk AI systems under the EU AI Act, which are required under that Act to achieve an appropriate level of cybersecurity, will be deemed to comply with those requirements if the security requirements under the CRA are met.

- any vulnerabilities (i.e., any weakness, susceptibility or flaw that can be exploited by a cyber threat) can be addressed through security updates and within an appropriate time frame;
- PDEs are protected against unauthorised data access, modification or manipulation, and that any data corruption or possible unauthorised access is reported;
- PDEs are designed, developed and produced to limit attack surfaces, to reduce the impact of any incidents through exploitation mitigation mechanisms, and minimise negative impacts on the availability of services provided by other devices or networks; and
- the principle of data minimisation is observed.

I. MANUFACTURERS

General obligations

- **Cybersecurity risk assessments:** First, manufacturers are required to assess the cybersecurity risks associated with PDEs based on the intended purpose and reasonably foreseeable use of the PDE, as well as the conditions of use of the PDE. Manufacturers must take the cybersecurity risk assessment outcome into account during the planning, design, development, production, delivery and maintenance phases of the life cycle of PDEs (the so-called “*support period*”), with a view to minimising cybersecurity risks, preventing security incidents and minimising the impact of such incidents. Cybersecurity risk assessments – to be included in the technical documentation of PDEs placed on the EU market – must be appropriately documented, updated and comprise the analysis of risk associated with the intended purpose or foreseeable use of the PDE as well as the conditions of its use.

There are also due diligence obligations when sourcing third-party components for PDEs, to ensure that such components do not compromise the cybersecurity of the product.

To facilitate compliance with the CRA, the EU cybersecurity agency (ENISA), together with the European Commission’s Joint Research Centre, published a **report** mapping the CRA’s cybersecurity and vulnerability handling requirements with the relevant existing cybersecurity standards. This report also highlights gaps to be addressed.

- **Conformity assessments:** Manufacturers are required to conduct conformity assessments to establish whether essential cybersecurity requirements have been fulfilled in relation to the PDE and that the manufacturer meets the vulnerability handling requirements, except in limited cases where a presumption of conformity exists.

The CRA sets out different obligations depending on the criticality of PDEs. For lower risk PDEs (i.e., those in the “default category”), the conformity assessment procedure may involve a self-assessment by a manufacturer using one of the methods prescribed under the CRA. However, PDEs that are considered “important products” (subdivided into “Class I” and “Class II”), due to the cybersecurity risk profile

associated with their functionality and intended use, are subject to additional requirements in relation to conformity assessments (which, in the case of Class II, would include the involvement of an authorised third party even where the product complies with harmonised standards, common specifications or European cybersecurity certifications). Lastly, the category of “critical products” includes PDEs which carry a significant risk of adverse effects in terms of ability to disrupt, control or damage a large number of other PDEs through direct manipulation.

How are PDEs classified?

- **Examples of Class I** include identity management systems software and hardware (including authentication and access control readers), stand-alone and embedded browsers, password managers, software that searches for, removes or quarantines malicious software, VPN, network interfaces, security information and event management systems, boot managers, network interfaces, public key infrastructure and digital certificate issuance software, operating systems, routers, firewalls, microcontrollers and microprocessors with security-related functionalities, smart home products with security-related functionalities and smart home general purpose virtual assistants, certain internet-connected toys, and certain personal, wearable products.
 - **Examples of Class II** include operating systems for servers, firewalls, intrusion detection or prevention systems, and tamper-resistant microprocessors and microcontrollers.
 - **Examples of “critical products”** include hardware devices with security boxes, smart meter gateways within smart metering systems, and smartcards or similar devices, including secure elements.
-
- **Declaration of conformity:** Once a manufacturer has complied with the conformity assessment requirement, it will be required to draw up an EU declaration of conformity with essential requirements prescribed by the CRA and, where applicable, the other relevant EU legislation applicable to the PDE. A single EU declaration of conformity will be required for compliance with all relevant EU legislation and must include, among other things, the name, type and any additional information enabling the unique identification of the PDE, and the name and address of the manufacturer. This EU declaration of conformity must be provided with the PDE in the instructions to a user, along with an Internet address where the declaration can be accessed. Manufacturers must also keep the technical documentation and the EU declaration of conformity for at least ten years after the PDE has been placed on the market and provide the relevant documents upon request of the market surveillance authorities (MSAs). Further, manufacturers must affix the “CE” marking on the PDEs (indicating that the manufacturer has checked that the product complies with EU requirements). By drawing up the EU declaration of conformity, the manufacturer assumes responsibility for the compliance of the product.

- **Vulnerability handling:** When placing a PDE on the market and throughout the support period, manufacturers will be required to ensure that product vulnerabilities are handled effectively. This includes:
 - identifying and documenting vulnerabilities;
 - applying effective regular testing and addressing and remediating vulnerabilities without delay;
 - providing security updates in a timely manner and security patches free of charge and without delay to address identified security issues (and providing associated information); and
 - providing a contact address for the reporting of vulnerabilities and enforcing a co-ordinated vulnerability disclosure policy to process and remediate vulnerabilities.

In principle, the minimum support period is 5 years. However, the CRA allows for a support period of less than five years where the PDE is expected to be in use for less than five years and this shorter use time is justified by the nature of the product. In these cases, the manufacturer should ensure vulnerability handling for that lifetime. For example, subscription-based software or apps that become unavailable once the subscription expires may have a shorter lifetime where they can reasonably be expected to be in use for less than five years. Where the time the PDE is reasonably expected to be in use is longer than five years (e.g., hardware components such as motherboards or microprocessors, network devices such as routers, modems or switches, as well as software, such as operating systems), manufacturers should accordingly guarantee longer support times. It is the responsibility of the manufacturer to determine the relevant support period, taking into account relevant factors, including reasonable user expectations, the nature of the PDE, and relevant EU law determining the lifetime of such PDE. The European Commission is also authorised to specify minimum support periods for specific product categories, via delegated acts, where market surveillance data points to inadequate support periods.

Incident reporting

- **Informing authorities:** If a manufacturer becomes aware of any **actively exploited vulnerability** (defined as a vulnerability for which there is reliable evidence that a malicious actor has exploited it in a system without permission of the owner) contained in the PDE, or of any severe incident having an impact on the security of the PDE (**severe incident**), it must report it and notify the Computer Security Incident Response Team (CSIRT) and the EU Agency for Cybersecurity (ENISA) without undue delay and in any event within 24 hours of becoming aware, by means of an early warning notification. A specific Member State CSIRT may be designated as the co-ordinator, where the manufacturer has its main establishment in the EU. Also, unless the relevant information has already been provided, the manufacturer must submit a vulnerability or incident notification without undue delay and in any event within 72 hours. The manufacturer must also submit a final report no later than 14 days after a corrective or mitigating measure is available (in the case of an actively exploited vulnerability), or within one month after the submission of the incident notification (in the case of a severe incident). The information to be provided at each stage differs according to whether an actively exploited vulnerability or severe incident is being reported.

The act of notifying an incident or actively exploited vulnerability will not subject the notifying natural or legal person to increased liability. ENISA is required to establish, manage and maintain a ‘single reporting platform’ for notifications.

- **Informing users:** The manufacturer must also inform the impacted users of the PDE (and, where appropriate, all users) in a timely manner of an actively exploited vulnerability or a severe incident and, where necessary, about risk mitigation and any corrective measures that they might deploy to mitigate the impact.
- **Informing the public:** In addition, if informing the wider public is needed to prevent or mitigate a severe incident that affects the security of PDE, to handle an ongoing incident, or if revealing the incident is in the public interest, the CSIRT designated as co-ordinator may, after consulting with the manufacturer (and where appropriate with ENISA’s involvement), inform the public about the incident or require that the manufacturer do so.

Technical documentation and transparency

Manufacturers are required to draw up technical documentation, which must contain all relevant data used by the manufacturer to ensure that the PDE and the processes put in place by the manufacturer comply with the essential cybersecurity requirements under the CRA, before the PDE is placed on the market. This includes a description of the design, development and production of the PDE and vulnerability handling processes, the cybersecurity risk assessment, vulnerability tests and handling processes, the software bill of materials (if applicable), a copy of the EU declaration of conformity, and the additional information required by any relevant EU acts (such as other product regulations).

This technical documentation must be continually updated during at least the support period. The documentation must also be kept at the disposal of the MSAs for ten years after the PDE has been placed on the EU market.

The CRA provides detailed requirements for manufacturers to provide certain information in an easily accessible manner, such as their contact details, designated ‘single point of contact’ and the end date of the PDE’s support period. For example, the end date of the support period must, where applicable, be stated on the PDE, its packaging, or be provided by digital means at the time of purchase.

Appointed representatives

Manufacturers may appoint authorised representatives by a written mandate to perform specific tasks required by the CRA. Authorised representatives can take on some tasks under the CRA (e.g., in relation to cooperation with MSAs) but not certain obligations (e.g., responsibility for the cybersecurity risk assessment).

II. IMPORTERS AND DISTRIBUTORS

The CRA also introduces due diligence obligations for importers and distributors of PDEs. In particular, before placing or making available a PDE on the EU market, importers and distributors must ensure that the relevant conformity assessment has

been carried out by the manufacturer (or, in the case of distributors, that a declaration of conformity has been provided or is available), that the “CE” marking has been affixed, and that the PDE is accompanied by the required information, documentation and instructions.

Importers or distributors identifying a vulnerability in a PDE are also required to inform the manufacturer without undue delay. If an importer or a distributor has reason to believe that a PDE presents a significant cybersecurity risk, it must immediately inform the manufacturer and relevant MSAs.

Importers and distributors are also subject to certain other reporting obligations (e.g., informing, without undue delay, the manufacturer and the MSAs where PDEs present a significant cybersecurity risk), product recall, withdrawal or corrective measures where PDEs not in conformity with the CRA are made available on the market, and record-keeping requirements (e.g., keeping, at the disposal of the MSAs, a copy of the EU declaration of conformity and all documentation necessary to demonstrate the conformity of the PDEs and processes put in place by manufacturers with the CRA).

III. OPEN-SOURCE SOFTWARE STEWARDS

The CRA contains a focus on free and open-source software, including the concept of an ‘open-source software steward’ upon which specific obligations are imposed. A steward is any legal person, other than a manufacturer, which has the purpose or objective of systematically providing support on a sustained basis for the development of specific PDEs qualifying as free and open-source software that are intended for commercial activities, and ensures the viability of those products.

A steward must put in place and document in a verifiable manner a cybersecurity policy which fosters the development of secure PDEs and demonstrates effective handling of vulnerabilities by the developers of PDEs. The cybersecurity policy must take into account the specific nature of the open-source software steward and the legal and organisational arrangements it is subject to.

Open-source software stewards must cooperate with the MSAs and provide them with the relevant documentation at their request, with a view to mitigating the cybersecurity risks posed by a PDE qualifying as free and open-source software.

MARKET SURVEILLANCE, ENFORCEMENT AND PENALTIES

Guidance

In order to ease implementation and ensure consistency, the European Commission will publish guidelines to assist economic operators with applying the provisions of the CRA, with a particular focus on how to facilitate compliance by microenterprises, small enterprises and medium-sized enterprises.

Enforcement

Member States	EU level
<p>Member States will each designate one or several MSAs to ensure the supervision and enforcement of the CRA at national level, including in relation to the evaluation of PDEs which present a significant cybersecurity risk, the issuance of guidance to operators, and the imposition of corrective or restrictive measures and penalties. For PDEs under the CRA that would also be classified as “high-risk AI systems” under the EU AI Act, the MSAs designated for the purposes of the EU AI Act will in principle be the authorities responsible for market surveillance activities required under the CRA. Also, the national conformity assessment bodies competent under the EU AI Act should also be competent for the purposes of the CRA in certain cases.</p> <p>Economic operators should fully cooperate with MSAs and other competent authorities.</p>	<p>Unlike the EU General Data Protection Regulation for instance, the CRA does not establish a one-stop shop mechanism for cross-border infringements. However, it notably establishes an EU supervisory structure in the form of a dedicated cooperation group (ADCO) to ensure the uniform application of the CRA. This ADCO will be composed of representatives of the designated MSAs and, if appropriate, representatives of single liaison offices. Representatives from the European Commission will also be involved.</p>
<p>MSAs have the power to access all data and related internal documentation that must be retained by organisations under the CRA (including information with respect to the design, development and vulnerability handling of such products).¹</p>	<p>The European Commission has a central role and specific powers as regards the oversight of the CRA, including ensuring appropriate coordination between notified bodies, proposing joint activities for checking compliance with the CRA to be conducted by MSAs and ensuring that decisions adopted by Member States in respect of the CRA are in line with EU law.</p> <p>In addition, the CRA contains a “Union safeguard procedure” which notably allows the European Commission to settle objections raised by Member States in relation to measures implemented by another Member State (including the prohibition or withdrawal of products by MSAs). Where, following evaluation, the national measure is considered unjustified, it must be withdrawn. Conversely, where the national measure is deemed justified, all Member States must adopt it and take the necessary measures to ensure the non-compliant PDE is withdrawn from their market. A similar procedure applies where the European Commission itself considers a measure that has been implemented by a Member State to be contrary to EU law.</p> <p>Further, there are circumstances where the European Commission can directly intervene and adopt implementing acts to provide for corrective or restrictive measures (including product recalls or withdrawals), at Union level, in the face of PDEs presenting a significant cybersecurity risk.</p>

¹ Other EU authorities will also benefit: for instance, national data protection supervisory authorities have the right to access all documentation created to comply with the CRA, when such documentation is relevant for the fulfilment of their tasks, and MSAs would have an obligation to report any information of interest to the European Commission and the relevant national competition authorities.

Penalties and sanctions

Depending on the nature of the violation, maximum fines can range from up to EUR 5 – 15 million or up to 1 – 2.5% of worldwide turnover in the preceding financial year, whichever is higher:

- Breaches of the essential cybersecurity requirements, conformity assessment and reporting obligations may result in administrative fines of up to EUR 15 million or up to 2.5% of annual global turnover, whichever is higher.
- Breaches of the other CRA rules, including requirements to appoint an authorised representative, obligations applicable to importers or distributors, and certain requirements for the EU declaration of conformity, technical documentation and CE marking, may result in administrative fines of up to EUR 10 million or up to 2% of annual global turnover, whichever is higher.
- Organisations which provide incorrect, incomplete or misleading information face administrative fines of up to EUR 5 million or, if the offender is an undertaking, up to 1% of annual turnover.

The EU Member States lay down the rules on applicable penalties, in accordance with the CRA, and impose the relevant fines.

Size and market share of an operator are among the factors to be taken into account when determining the amount of an administrative fine.

Non-compliance with CRA requirements may also result in corrective or restrictive measures, including the MSAs or the European Commission recalling or withdrawing products from the EU market.

NEXT STEPS AND TRANSITIONAL PROVISIONS

The CRA was published in the Official Journal of the European Union on 20 November 2024. It enters into force on 10 December 2024. Various transition periods will apply, with most of the CRA obligations becoming fully applicable from 11 December 2027.

The relevant economic operators will thus be given a grace period of up to 36 months to adjust to the provisions of the CRA, during which time further regulatory guidance is expected. Reporting obligations concerning actively exploited vulnerabilities and severe incidents will apply from 11 September 2026, however, and the provisions on notification of conformity assessment bodies will apply from 11 June 2026.

EU-type examination certificates and approval decisions issued regarding cybersecurity requirements for PDEs that are subject to EU harmonisation legislation other than the CRA will remain valid until 11 June 2028, unless they expire before that date or unless otherwise specified in the relevant harmonisation legislation. PDEs placed on the market prior to 11 December 2027 will only be subject to the requirements of the CRA if they undergo a substantial modification from that date. This shouldn't affect the reporting obligations that kick in from 11 September 2026, however. Also, if a new category of PDE is added to Annex III (Important PDEs) or is moved from Class I to Class II, in most cases there should be a transition period of 12 months before the relevant conformity assessment procedures apply.

It is crucial for affected businesses to begin preparing for compliance, including integrating CRA security requirements into the design cycle of their products and creating or amending internal procedures to meet CRA requirements.
